

Geothermal Energy Generation in Oil and Gas Settings: Renewable Energy Credits for the Gulf Coast States

Presented by Tim Smith March 13, 2006

Overview of the Presentation

- # Who is Element Markets?
- # What is a REC?
- # What markets exist for RECs?
- ‡ A look at Louisiana, Mississippi, Alabama, Oklahoma, and Texas markets

Who is Element Markets?

- Started in 2004 as an emission and renewable energy credit asset management company
- ‡ Element Markets wants to take on the role of being an asset manager with strategic partners in select markets
- We guide our clients in their decision-making process making us a "part of the team" vs. an outsourced brokerage or consulting function.
- # We provide in-depth market due diligence, analysis, and trading strategies to maximize our clients revenue potential
- ‡ Our commercial experience and market intelligence is unmatched
- # We focus on developing client relationships with developers and utilities

What is a REC and How Does It Work?

- ‡ REC = Renewable Energy Credit
- ‡ A renewable generator produces 2 products when it creates electricity:
 - System energy
 - " REC
- ‡ A REC is a marketing right that allows the owner to virtually overlay it on his system energy to create renewable electricity
- ‡ One REC is equivalent to one MWhr of energy
- ‡ RECs work on a broader time frame and geography compared to system energy

A Few Notes About REC Markets

- # Markets are very illiquid
 - " Wide Bid/Offer Spread
 - This is a compliance purchase only and is not a hedged commodity
 - " Few, if any, people speculate in REC markets
 - " Compared to electricity, REC prices are relatively low
 - 2-3 trades in a week for a market is considered active
 - " Little to no speculation
- ‡ Buyers generally don't have the time or resources to give much thought to their purchase obligations
- ‡ Sellers often don't have the time or resources to try to extract value from their renewable assets
- ‡ Few brokered deals are done
- ‡ Price discovery is very difficult to achieve
- ‡ Contracts, especially for voluntary REC markets, can be cumbersome and risky

Element Markets LLC

Types of REC Markets

‡ VOLUNTARY

- Demand driven by marketing
- Rules are not clearly defined
- Little regulation
- Almost no liquidity
- Purpose: To drive the development of new renewables
- " Size: Over 5 million MWhrs in 2005
- Price: Less than \$1/REC

MANDATORY (RPS)

- Driven by statute or regulation
- Rules are clearly defined
- " Highly regulated
- Slightly better liquidity
- Purpose: To drive the development of new renewables
- Size: Over 20 million MWhrs in 2005
- Price: Average is over \$3/REC

States with a RPS

Renewable Portfolio Standards

Goal

Voluntary Markets

- ‡ Includes Alabama, Louisiana, Mississippi and Oklahoma
- t Voluntary markets are buyer's markets
 - " Can choose from a variety of resources
 - " Can choose from anywhere in the country
 - " Have flexibility in the age of the facility
- ‡ Prices are low
- ‡ Louisiana has the most advanced RPS discussions of these states

General Observations on RPS Markets

- t No 2 RPS markets are alike
 - " Geographic boundaries
 - Shelf life
 - " Potential Resources
 - " Classes or Tiers
 - " Targets
 - " Penalties
- ‡ Further changes are likely to occur
 - " Connecticut
 - " Texas
- ‡ Geothermal is universally recognized as a renewable generating resource

RPS in Texas

Tracking System	Unnamed, administered by ERCOT
No. of Classes	1
Unusual Resources	Solar Thermal
Geography	Anywhere in Texas
Credit Multipliers	No
Shelf Life	3 years
2006 Target	1.4%* (3.4 million MWhrs)
2011 Target	3.3%* (8.9 million MWhrs)
Current Pricing	\$7.75

Method to Calculate of the State-wide RPS Requirement

```
\ddagger RPS = Q * CCF * 8760
```

- " Q = Assumed capacity for the year
 - ± 2002-2003 = 400 MW
 - ± 2004-2005 = 850 MW
 - ± 2006-2007 = 1400 MW
 - ± 2008-2009 = 2392 MW
 - ± 2010-2011 = 3384 MW
 - ± 2012-2013 = 4376 MW
 - ± 2014-2015 = 5000 MW
- CCF = Capacity conversion factor of wind
- $_{*}$ 8760 = Hours in a year

Setting the CCF

- ‡ The effective capacity factor of wind is at about 27%
 - " Distribution congestion
 - " Wholesale transmission congestion
- t The CCF has been reduced to 27.6% from 35%
 - " The change occurred in the second half of 2005
 - The adjustment will be made retroactive to 2004 requirements
- CCF is adjusted on a biannual basis to reflect actual capacity of REC-generating facilities since the inception of the program
- CCF for 2006-2007 will be 27.9% (set at the end of 2005)

Translating RPS Requirement to Usage

- ‡ In 2003, the total RPS requirement came to be about 1,226,400 MWhrs
- In 2004, the total RPS requirement came to be about 2,606,100 MWhrs
- ‡ RPS in 2003 amounted to slightly less than 0.6% of the load for a given competitive retail provider
- After adjustments due to the CCF, the total RPS requirement for 2005 will be around 1,600,000 MWhrs

Historical Pricing for TX RECs
